

Technical support specialist

Take-home exercise

At Mamo, there are four common parts to a customer support interview:

1. A take-home challenge (documented here)
2. An initial screening call (to understand your background, experience, and ability to handle support at Mamo)
3. A role-fit assessment (by the hiring manager/coach)
4. A general interview for culture and personality fit

What will you be tested for?

This challenge is designed to look like a normal week at Mamo and includes:

- Scenarios that merchants and their customers typically ask us
- An integration task typically handled by our technical support team

There's no deadline for completing this challenge. Most candidates spend around 2-4 hours total across both parts. Work at whatever pace produces your best, most honest work – we'd rather see how you actually think than see you rush.

Once you submit your responses and if you're successful, we'll schedule a short live call to talk through your responses.

What we're evaluating:

- How clearly you communicate with a non-technical customer
- How you handle a situation that isn't really "yours" to fix
- Whether you can read API docs and get a real integration working end to end

Part 1 – Customer communication

Below are two support tickets, modeled closely on the kind of conversations our support team handles day to day. For each, write the reply you'd send the customer. Assume you have whatever internal access you'd realistically have (account details, transaction history, etc.) unless a ticket says otherwise.

Ticket A – Email, from a merchant

Dear Mamo team,

I was supposed to receive my payout yesterday and it's not in my account. I'm very bothered by this. How can I trust you with my money if it doesn't arrive when you say it will? Can you tell me what the delay is?

Sami

What you know internally (*not visible to Sami*):

- You've checked, and something is wrong on our side.
- The team is investigating. You don't yet know the cause or when it'll be fixed.

[Write your reply to Sami.](#)

Ticket B – Live chat, escalated from our AI assistant

hi i want my money back. i ordered a phone case from glowtechstore.com 12 days ago, it never arrived, and when i emailed them twice they didn't respond. i saw "MAMOPAY" on my card statement so i'm messaging you instead. please refund me AED 89 today, this is ridiculous

What you know internally:

GlowTechStore is a real business that uses Mamo. His payment did go through them 12 days ago. But we only move the money, we don't hold their stock, ship their orders, or decide their refunds. Only the business can refund him.

[Write your reply to this person.](#)

Ticket C – Email, from a merchant

Hi, I've asked three times now for a copy of my invoices for last quarter and nobody has sent them. I'm submitting my accounts on Sunday. This is the fourth email. Please just send them.

What you know internally:

He's right. He asked three times. Two of those emails were closed by mistake without a reply. You have the invoices and can send them right now.

[Write your reply to this person.](#)

Part 2 – Integration Exercise

This mirrors the kind of hands-on integration work our support team is expected to understand well enough to debug – not build a production system, just show you can read our docs, wire up a working flow in the sandbox, and reason about what could break.

What to build

- A minimal webpage that creates a one-time inline payment (`link_type: inline`) and embeds Mamo's checkout widget directly on the page (no redirect).
- A working subscription flow: define a recurring payment item (e.g. "Pro Plan – AED 49/month") and generate a payment link that lets a test customer subscribe to it.
- A webhook receiver (a simple local server is fine) that listens for `charge.succeeded`, `charge.failed`, `subscription.succeeded`, and `subscription.failed`, and logs the payload it receives.
- A short README (under one page) that explains, in plain language a new teammate could follow: (1) what happens end-to-end from a customer clicking "Subscribe" to Mamo confirming the first charge, and (2) if a merchant messaged you saying "my customer says they paid but I never got a webhook," what you'd check first, second, and third.

Resources

Item	Details
Sandbox base URL	https://sandbox.dev.business.mamopay.com/manage_api/v1
Sandbox access	Use the following API key: <code>sk-05f603dd-f4eb-42ed-a9af-c406dd1ebd6f</code>
Create payment link	POST <code>/links</code> – see mamopay.readme.io/reference/post_links (set <code>link_type: "inline"</code> for Part 2's one-off payment)
Inline widget guide	help.mamopay.com → Developers → "Inline payments integration" (checkout-inline JS snippet + iframe embed pattern)
Subscriptions	Created via the same POST <code>/links</code> API with subscription fields – see the "Subscriptions" section under mamopay.readme.io/reference/post_links
Webhooks	POST <code>/webhooks</code> – see mamopay.readme.io/reference/post_webhooks
Test card (success, no 3DS)	4659 1055 6905 1157 · CVV 123 · Exp 01/28
Test card (success, 3DS)	4242 4242 4242 4242 · CVV 123 · Exp 01/28 · 3DS password: Checkout1!
Test card (decline)	4567 3613 2598 1788

Language/stack is your choice (we mainly work in Node.js/TypeScript, but this is a support role, not an engineering one — use whatever gets you to a working result fastest and most comfortably).

We care far more about the README's clarity and your debugging reasoning than about production-grade code.

How to submit

- A link to a GitHub repo (public or invite-only) + a README.
- Your three written replies from Part 1 (doc/PDF).
- Send both to your Mamo recruiting contact.
- You're welcome to use any AI tools you'd normally reach for day-to-day. Just include a quick note in your submission about how you used them.

Questions at any point before submitting? Just reply to the email this exercise came with — we'd genuinely rather you ask than guess and go down the wrong path. That's true on the job too.
